### Trade Costs, Entry Costs, and the Spatial Distribution of Chinese Manufacturing Firms

with Kensuke Suzuki and Junfu Zhang

**Abstract:** This paper examines sectoral growth patterns across Chinese provinces during the country's economic takeoff in the early 2000s, following key policy reforms including trade liberalization, infrastructure expansion, business climate improvements, and relaxed rural-to-urban migration restrictions. We develop a multi-sector, multi-region spatial general equilibrium model based on the Melitz-Chaney framework to analyze how these factors interact to influence the geographic distribution of manufacturing activities. We calibrate the model and conduct counterfactual simulations to identify the key mechanisms driving regional development. We find that reductions in trade costs intensify competition and deter firm entry, whereas lowered entry barriers foster firm creation. Together, these factors shape China's overall economic growth and regional specialization. Our decomposition exercises reveal that lowered business entry costs played a larger role than the reduction in trade costs in promoting welfare and that the growth of real wages, especially in inland regions, is primarily driven by the reallocation of resources towards more productive firms and the exit of less productive ones.
